

# *Tray POS*

automation tool for  
electronic payments

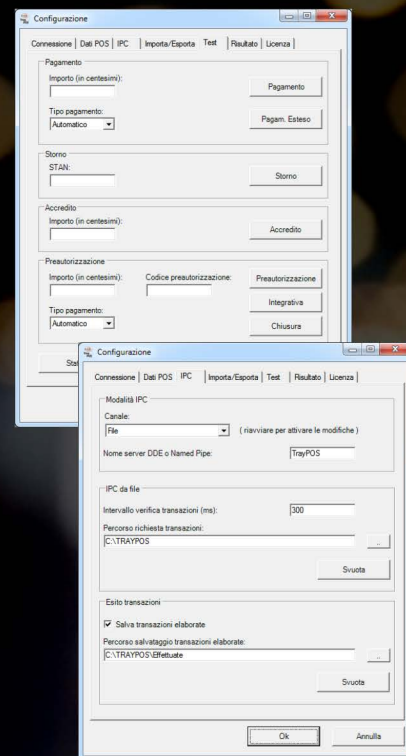

**STORM  
OPEN SOLUTIONS**

# A valuable component for your systems

E2K TrayPOS is a companion software that allows to easily interface sale systems or applications that require the collection of payments with ATM cards ('Pago Bancomat') or credit cards, through Jusp certified payment terminals.

The data exchange can happen in different ways (files, DDE, named pipes, websockets), thus making integration with existing systems very flexible. E2K Tray POS is licensed on a per-computer basis, using an unlock code that depends on the hardware used.

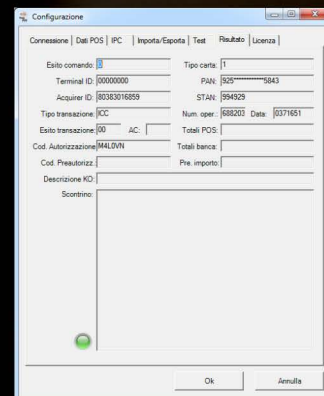

# Simple, useful and time saving

There are several advantages in using an automatic system:

- 1) speed: the operator only has to confirm the amount on the screen in his system; the payment terminal receives the amount and only requires card reading ; in points of sale with high-turnout, this is a time-saver;
- 2) security: the amount transacted is exactly the amount due; how many times, in a hurry or because of a distraction, the clerk forgets or reverses the decimal digits? E2K TrayPOS avoids making mistakes;
- 3) correct sequence of operations: adding automation in the payment phase prevents performing tasks out of order.

E2K TrayPOS allows to drive all Jusp certified payment terminals, connected via USB or Bluetooth.

The transaction requests can be sent in different ways; classic file sharing ease integration with systems on different platforms (Unix, AS/400), while DDE, Named Pipes and Websockets allow an advanced and efficient dialogue on Windows systems. The received and processed transaction requests can be stored along with the results, for greater control.
